

Activation functions apply a
nonlinear transformation
and decide whether a
neuron should be activated or not.

Activation Functions

Step Function

Sigmoid

TanH

ReLU

Leaky ReLU

Softmax

Step Function

$$f(x) = \begin{cases} 1 & \text{if } x \geq \theta \\ 0 & \text{otherwise} \end{cases}$$

Sigmoid

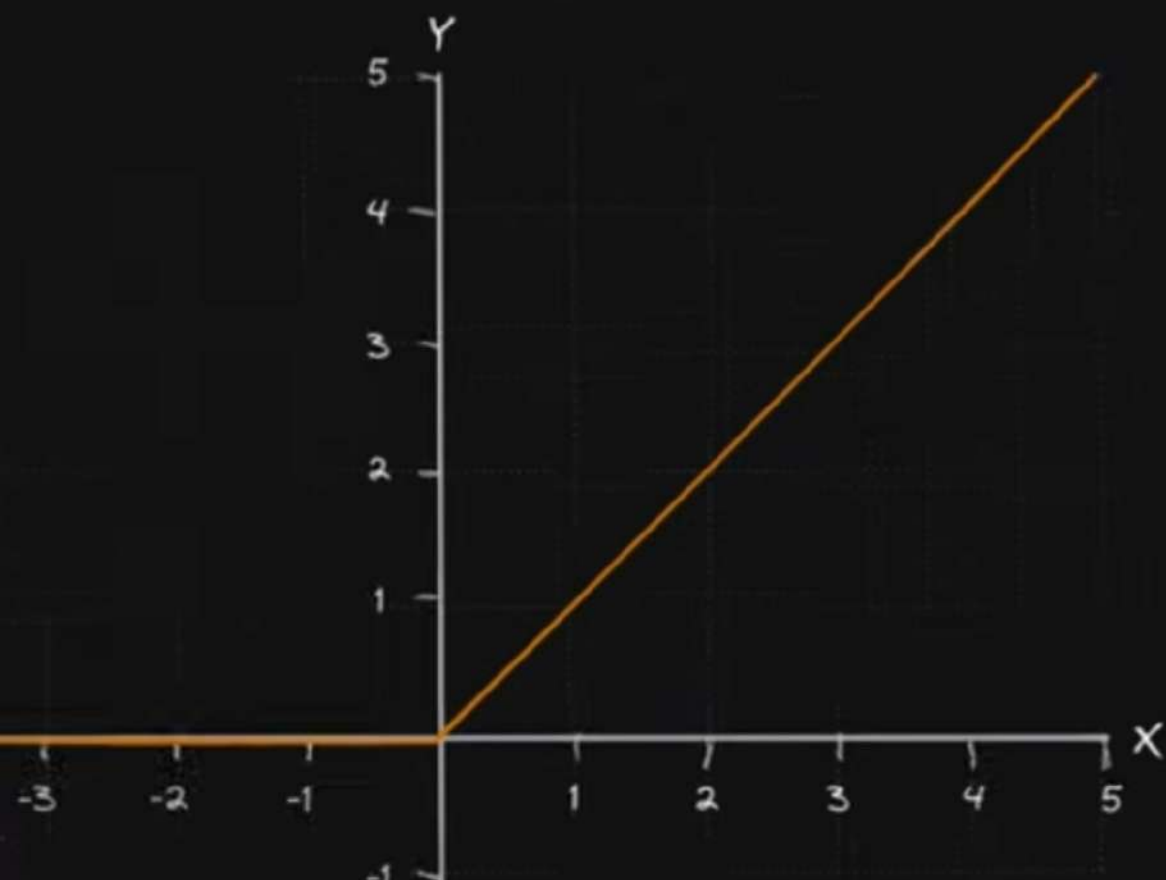

$$f(x) = \frac{1}{1+e^{-x}}$$

TanH

$$f(x) = \frac{2}{1+e^{-2x}} - 1$$

Values less than or equal to 0: 0

Values greater than 0:

The input value

ReLU

$$f(x) = \max(0, x)$$

Leaky ReLU

$$f(x) = \begin{cases} x & \text{if } x \geq 0 \\ a \cdot x & \text{otherwise} \end{cases}$$

Softmax

$$S(y_i) = \frac{e^{y_i}}{\sum e^{y_i}}$$

Softmax

Softmax

$$f(y_i) = \frac{e^{y_i}}{\sum_k e^{y_k}}$$

Softmax

- 1 - Softmax function converts real values into probabilities.
- 2 - It only used as output layer of neural network.
- 3 - You can consider higher probability as actual output.
